

Insight Trading

Beginner Setup & How-To Guide

From an access code to your first practice trade - and understanding what the app tells you along the way. Practice money only; research tool, not financial advice; app v783, August 2026.

1. Set up in five minutes

You need a phone or computer with a web browser, and your access code (a trial code or your own password, given to you by Insight Trading).

Step 1 - Open the app. Go to the web address you were given. It runs entirely in the browser - nothing to install from an app store.

Step 2 - Enter your access code. Type it exactly as given. A trial code works on two devices - typically your phone and your computer.

Step 3 - Add to home screen. iPhone: Safari > Share > "Add to Home Screen". Android: Chrome menu > "Add to Home screen" (or "Install app"). It then opens full-screen like a normal app.

Step 4 - Choose Starter or Advanced (tabs, top-left). Starter is simplified; Advanced shows every scan and setting. This guide uses Advanced so names match - everything important also exists in Starter.

Practice money only. Every dollar in this app is simulated. The whole point is to learn - and to feel a losing streak - before any real money is ever involved anywhere.

2. Your first data load

The app works on **end-of-day data** - prices and volumes as of each market close. Not a live ticker, on purpose: decisions are made calmly after the close. Press the green "**Refresh / redownload data**" button (the lightning "Load" does the same elsewhere). The first load fetches ~2,200 investable ASX shares - ordinary shares only; warrants, notes and bonds are skipped and the banner says so ("skipped by type"). First load is the slow one; the daily "Load" after the close takes seconds.

Banners: "Volume, streaks & signals ready - from the data saved on this device" is normal (signals compute locally). "The live list came back smaller than expected" is protection - the app keeps your fuller saved view rather than trusting a bad download; tell support if it persists. Take app updates when the top banner offers them.

3. The screen, in one tour

Market Radar (top) - counters for gainers/losers, volume events, trends and Evidence. **Every tile is tap-to-filter**: taps combine; "Showing" clears.

The table - one row per share: price, change, PN EDGE, volume vs its own 3-month average, streaks, score /10, signal chips. Tap a code for its report card; tap the star to watchlist.

Left panel - data buttons, settings, the scans: the "searches, not verdicts" group (Breakout, Technical, Penny Movers...) and the graded pair, **Best Evidence Today** and **Climbers Today**.

Header - practice balance, Watchlist, Lessons, Training.

4. The four-tap daily routine

After each market close, the "START YOUR DAY" row gives you the whole day in four taps - a few minutes, total. Everything else in the app is depth for when you want it.

1	Market Today	The breadth snapshot - how many rose vs fell, where the volume went. Ten seconds of context.
2	Top 20 to Watch	Ranked by proven evidence first, then the accumulation score /10. A quiet share with real evidence can outrank a lively one with none - the activity note says which is which.
3	Best Evidence Today	Only shares whose strongest firing signal carries a graded, positive edge. The shortlist with receipts.
4	Today's picks	What the tested rules would buy - sized, priced, reasons attached. Some days the honest answer is "nothing qualified": the system working, not failing.

5. Pick your rule set - start with Defender

Open "**My trading rules**". Three ready-made rule sets sit at the top; one tap applies and saves the whole set and switches the practice robot on with it.

Defender	Profit 15% / stop 15%, small positions.	Won 64.1% of trades over ten years; worst drawdown -8.5%; longest losing run 11.	Beginners - most trades win, the account never craters.
All-round er	Profit 20% / stop 15%, band \$0.20-\$1.99.	The evidence-backed default; its band was re-derived on the ten-year test.	Once Defender feels boring.
Hunter	No take-profit, no fixed stop - a 20% trailing stop does all exits.	The return peak - wins far less often; profit comes from rare big runs.	After you have survived a streak.

Shared by all three: 2% dip entry (deeper dips missed winners in the ten-year test); 1% of the account risked per trade; 5-day cooldown after a stop-out; robot buys only when the index is above its 50-day average. Edit any number after - Save keeps it; just know the preset numbers are the tested ones, so every edit is a knowing departure from the evidence.

6. The robot and the report-card ladder

The robot makes practice buys each data day, following your rules exactly. **Leave "Auto-follow my report-card ladder" ON:** it buys only shares firing the top-rated PROVEN signals on your own report card, and follows automatically as signals prove or fade - no re-ticking. Its default source lane, "Best proven scan (auto)", follows whichever lens your card currently grades best. Many days it buys nothing - the gates (score, band, dip, risk, cooldown, index) are strict on purpose.

7. Reading evidence: what a PN Edge means

Every signal the app can fire is **replayed against ten years of history** and asked one question: after it fired, did shares beat the market - **and could the answer just be luck?** A handful of good results might be luck, like a five-star cafe with three reviews. Hundreds of steady results across the years are a different thing - luck cannot fake that for long.

SOLID - the record is strong and steady enough that luck is practically ruled out. **PROMISING** - it looks real, but the evidence is thinner: fewer firings, or bumpier results. **NOT PROVEN** - luck could still explain everything seen so far, so no badge is given - and the robot is not allowed to buy it. A badge is only ever awarded when the edge is positive. *(For the statistically minded: SOLID means the edge is at least 2.5 times its own margin of error; PROMISING at least 1.5.)*

"+\$1.38 / \$100" means: historically, \$100 placed on this signal returned \$1.38 more than the market over the holding window - measured across every firing, e.g. 1,127 of them. The ranking, the robot and Best Evidence all run on this number. The **PN EDGE radar tile** filters the whole table to shares carrying a proven positive edge today - one tap, combinable with any other tile.

"These are searches, not verdicts." The scans in that boxed warning find shares matching patterns which, when tested, showed no edge. For looking - never a reason to buy. Only the report card is evidence.

8. Your watchlist

Tap the star on any row. The list remembers **why** you starred it - the score and signals at that moment - so weeks later you can see whether your eye was any good. Tap a starred row to add a note. **"How is my eye?"** grades your past stars against what actually happened, and a stale-star sweep flags shares that no longer fire anything - so the list stays a tool, not a museum.

9. Losing streaks - the part nobody tells beginners

Even the gentlest tested rule set (Defender) had a losing streak of **11 trades** inside its winning decade. Not a malfunction - arithmetic. Three rules make streaks survivable:

- 1. Size so a loss is boring.** At 1% risk per trade, an 11-loss streak costs about 10% of the account - painful, recoverable.
- 2. Take every qualifying trade or none.** Trend profits come from a few big winners; skip trades and you are absent for exactly those.
- 3. Practise until a streak has been felt.** That is what the fake money is for. Judge a rule set by whether you can live with it, not by a week.

10. Lessons and Training

The **Lessons** button holds fifty-plus short lessons with quizzes - including where the app's own ideas failed testing. **Training** replays real historical days against your rules, so you practise decisions where the outcome is knowable. Written copies of this guide (PDF and slides) live at the top of the Lessons panel.

11. When something looks wrong

No company names / short list - press "Load" again; persists? tell support. **Scores all zero** - the first history load has not finished; give it time, "Load" once more. **Dashes in the Evidence row** - that view has not been evidence-checked; tapping any evidence tile runs the check. **Anything else** - screenshot it: the exact screen is the fastest bug report there is.

12. The promises this app makes you

Every claim is tested against ten years of real data before it is shown - and **negative results are published where you read the claim**, not hidden. When a popular idea failed its test (gap trading, "smart money" scans, buying deeper dips), the app says so in plain sight. Scores and signals are estimates inferred from price and volume - not recommendations, not predictions. Verify everything against official sources, and treat this app as what it is: a place to practise judgement with honest numbers.
